

Keep An Eye On Your Project

August 2009

“Designed to meet budget and monitoring demands of short-term and long-term dredging projects”

That's DredgeCam, one of two new monitoring systems introduced at WEDA in Arizona (see page 18) by webcam software and technology specialists [EarthCam](#).

“It's built of marine grade materials for caustic environments and includes a pressurised aluminium housing, vibration isolation for jitter-free video and a 300x zoom,” says the firm, which also offers ConstructionCam – “for long-term projects in harsh conditions, the camera provides a 35x optical and 12x digital zoom.”

The two cameras are powered by [EarthCam's Control Center 7](#) management software, “which as well as archiving and documentation of projects, features a project dashboard, live video pan-tilt-zoom control, multiple view presets, aerial and satellite views and automated progress reports.”
